From the Preface (See Front Matter for full Preface)

Electronic computers have evolved from exiguous experimental enterprises in the 1940s to prolific practical data processing systems in the 1980s. As we have come to rely on these systems to process and store data, we have also come to wonder about their ability to protect valuable data.

Data security is the science and study of methods of protecting data in computer and communication systems from unauthorized disclosure ...

Full text available: pdf(838.00 KB) Additional Information: full citation, abstract, references, index terms

Publishing data about individuals without revealing sensitive information about them is an important problem. In recent years, a new definition of privacy called *k*-anonymity has gained popularity. In a *k*-anonymized dataset, each record is indistinguishable from at least $k - 1$ other records with respect to certain identifying attributes.

In this article, we show using two simple attacks that a *k*-anonymized dataset has some subtle but severe privacy prob ...

End users are often cast as the weak link in computer security; they fall victim to social engineering and tend to know very little about security technology and policies. This paper challenges this view as derogatory and unconstructive, arguing that users, as agents of organizations, often have sophisticated strategies regarding sensitive data, and are quite cautious. Existing work on user security practice has failed to consider how users view security; this paper provides content on and an ...

We consider an architecture for a serverless distributed file system that does not assume mutual trust among the client computers. The system provides security, availability, and reliability by distributing multiple encrypted replicas of each file among the client machines. To assess the feasibility of deploying this system on an existing desktop infrastructure, we measure and analyze a large set of client machines in a commercial environment. In particular, we measure and report results on ...

In the United States, artificial intelligence (AI) research is mainly a story about military support for the development of promising technologies. Since the late 1950s and early 196Os, AI research has received most of its support from the military research establishment [37, 55].1 Not until the 1980s, however, has the military connected this research to specific objectives and products. In 1983, the $600-million Strategic Computing Program (SCP) created three applicati ...

We outline a generic model for representing design deliberation and the relation between deliberation and the generation of method-specific artifacts. A design history is regarded as a network consisting of artifacts and deliberation nodes. Artifacts represent specifications or design documents. Deliberation nodes represent issues, alternatives or justifications. Existing artifacts give rise to issues about the evolving design, an alternative is one of several positions tha ...

Three cyphers allegedly authored by Thomas Jefferson Beale in 1822 have been the subject of intensive study for over 100 years. Generations of cryptanalysts have expended untold man-years, thus far without success, attempting to decode them; vast armies of fortune hunters and treasure seekers have devoted Herculean labors to digging up the

rolling hills of Virginia trying to locate the promised bonanza. The history of pertinent activities would fill volumes, yet serious students of cryptogr ...
